5 Stages of Data Discovery

CONNECT AND BLEND DATA

Gather the right data in one place. Data, scattered across many sources, must be placed in a single area where analysis can take place.

CLEANSE AND PREPARE DATA

Raw data imported from different sources can rarely be analyzed as-is. Data needs to be cleaned and formatted in ways that facilitate reliable and vast analysis.

SHARE DATA

With data constructed and free from redundant or unneeded information, it must be shared with others in the organization.

ANALYZE AND GENERATE INSIGHTS

Individuals can read, analyze, and create value from validated data when there is a single distributed version of the data.

VISUALIZE INSIGHTS

Take the information and insights drawn from the data and present it in an interactive graph or chart.
